"Verdek LLC Provides CNG Virtual Pipeline to Mobile Fueling Solutions"

Madison, CT November 19, 2013 - Verdek LLC a major U.S. distributor for Galileo CNG fueling technology solutions is working with Mobile Fueling Solutions (MFS) to introduce the first deployment of Galileo's Virtual Pipeline. This new technology is new to the U.S. but has been used in many locations worldwide for years. Specific to the U.S. market the Virtual Pipeline will make widespread conversion to CNG by America's fleet owners both practicable and economical.

"The benefits of fueling fleets with natural gas are clear. But, what comes first - the chicken or the egg? Converting vehicles or having the fueling infrastructure in place to support them? We have the complete solution." remarked Dean Sloane, CEO of Mobile Fueling Solutions. "This easy to implement, scalable solution will enable many more fleets to access the significant

savings and environmental benefits afforded by CNG. With limited or no capital expenditure, MFS provides fleet owners the opportunity to test and deploy a comprehensive CNG solution with minimal risk, thereby greatly simplifying the decision making process."

"Verdek is pleased to be participating in the effort to introduce this state-of-the-art technology in natural gas compression and decompression technologies to the U.S. market." commented Guy Mannino, CEO of Verdek LLC. "Galileo has developed a scalable and cost effective CNG road transport system that can supply natural gas to towns, remote CNG stations, mining operations, power plants and other industries that are many miles away from any gas pipeline."

About the Virtual Pipeline: The whole system is conceived based on Modularity, thus resulting in the following many advantages. Its modularity, in addition to the exclusive off-loading management system, maximizes the transported gas use and reduces the operating cost per cubic meter of natural gas. Scalability is achieved because the gas is transported with container modules (referred to as MATs) which allows the system to grow at the pace of demand. Any changes in consumption can always be matched with a specific number of MATs because the entire system is monitored remotely through Galileo's SCADA system. Transportability is achieved through the exclusive "VSTF" Transport System which transports the modules safely and easily to and from consumption points. Balance between operating and investment costs are achieved through the systems modularity and scalability allowing for optimal sizing to strike a perfect balance between operating and investment costs.

About Mobile Fueling Solutions, LLC: Mobile Fueling Solutions, LLC (MFS) provides true end-to-end alternative compressed natural gas (CNG) fueling solutions to fleet owners and managers including those without fixed CNG infrastructure. The Company is led by experienced CNG industry experts who understand the needs of fleet owners. MFS custom designs complete CNG programs that match the right vehicles to the right fueling infrastructure. MFS' suite of products and services includes conversions, fuel, fleet maintenance, training and management tools.

About GNC Galileo S.A: Since 1983, Galileo has been a global reference in modular technologies for both CNG and LNG production and transportation. Its portfolio includes the widest range of compressors and pumps for vehicles and vessels; pipeline boosters and wellhead compressors; and the Virtual Pipeline® system, for gas distribution by road, which can reach remote communities and industries without pipeline network connection.

About Verdek LLC: Verdek is a leading sustainable transportation solutions provider, offering the best options for CNG and LNG fueling solutions for fleets and industry. Exceeding consumer expectations is Verdek's primary goal which at the core includes providing the best solution for each client's specific requirements. Verdek has earned a reputation for being a sustainable transportation technology and industry expert company that is highly motivated and is continuously pursuing advancing technologies that help meet the cost and sustainability objectives of all their clients.
